

Singh-form comparison: $C=1$, $\beta=2$ fixed; one fitted ϕ_J per AR. All 42 runs are displayed.

Filled: N = 1000 Open: N = 500 Crossed: displayed, excluded from fit Error bars: 95% block-bootstrap intervals

† AR 4, $\phi=0.27$: late-window estimate over strain 35-50; start-window sensitivity is tabulated.

Mari-form fits with free amplitude, exponent and jamming fraction

$\eta_r = C(1-\phi/\phi_J)^{-\beta}$; straight lines on log-log axes have slope $-\beta$.

Filled: N = 1000 Open: N = 500 Crossed: displayed, excluded from fit Error bars: 95% block-bootstrap intervals

† AR 4, $\phi = 0.27$: late-window estimate over strain 35-50; fitted parameters depend on the model and retained window.
