

Singh-form comparison: $C=1$, $\beta=2$ fixed; one fitted ϕ_J per AR. All 42 runs are displayed.

Filled: N = 1000 Open: N = 500 All 42 points included in the fit Error bars: 95% block-resampling intervals

† AR 4, $\phi=0.27$, and AR 5, $\phi=0.16$: observed means over strain 2-50; long-interval variability retained.

$\eta_r = C(1-\phi/\phi_J)^{-\beta}$; straight lines on log-log axes have slope $-\beta$.

Filled: N = 1000 Open: N = 500 All 42 points included in the fit Error bars: 95% block-resampling intervals
