Relative viscosity versus concentration and distance to jamming

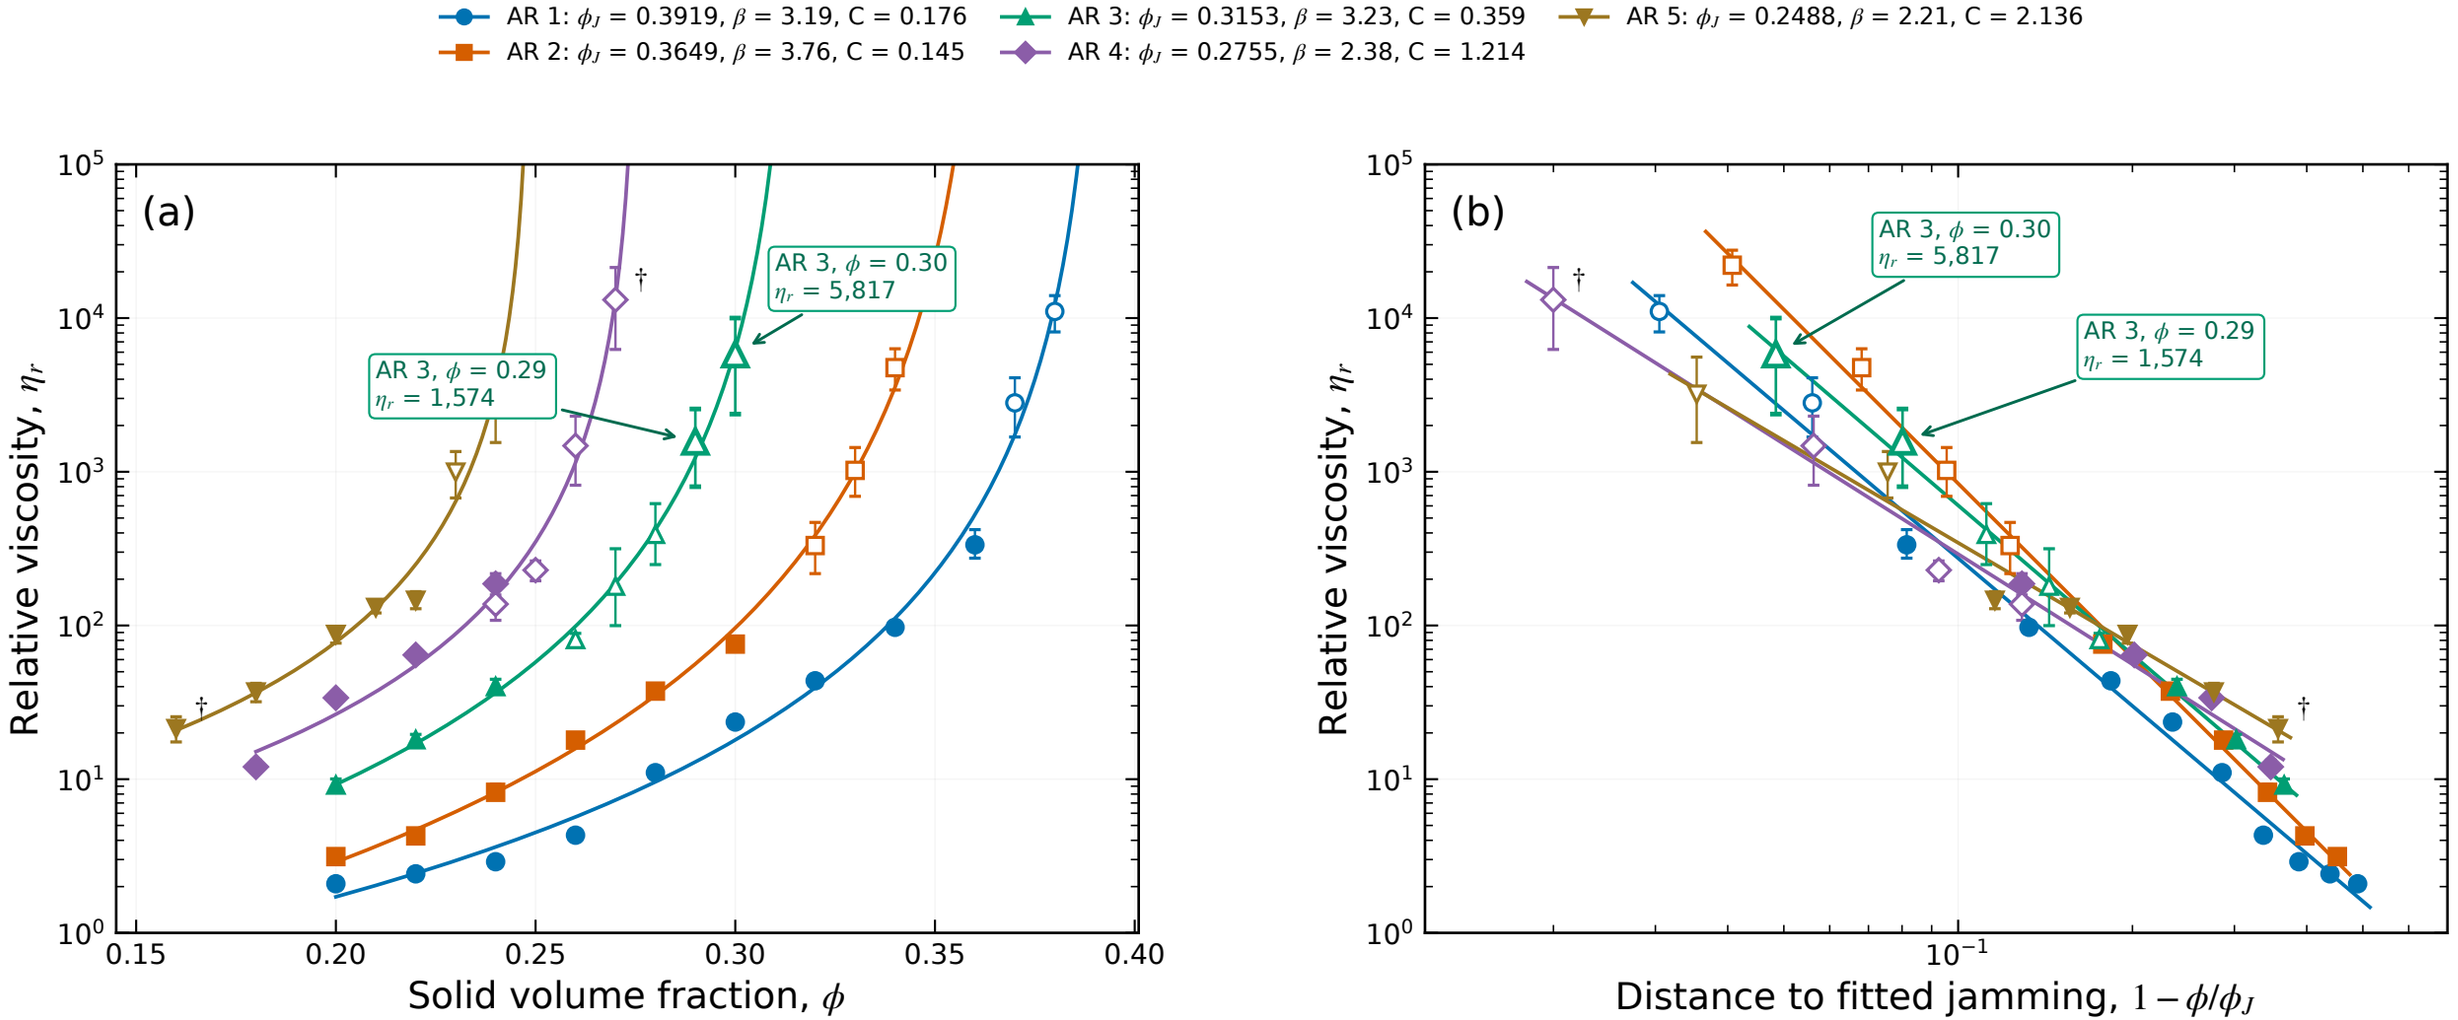

Singh-form: $C = 1$, $\beta = 2$ fixed; one fitted ϕ_J per AR.

44 runs included. Added AR 3 points at phi = 0.29 and 0.30 are labeled in both panels.

Filled: N = 1000 Open: N = 500 Error bars: 95% block-resampling intervals

† AR 4, $\phi = 0.27$, and AR 5, $\phi = 0.16$: strain 2-50 means; long-interval variability retained.

Mari-form fits with free amplitude, exponent and jamming fraction

Mari-form: $\eta_r = C(1-\phi/\phi_J)^{-\beta}$; C, β and ϕ_J fitted per AR.

44 runs included. Added AR 3 points at phi = 0.29 and 0.30 are labeled in both panels.

Filled: N = 1000 Open: N = 500 Error bars: 95% block-resampling intervals

† AR 4, $\phi = 0.27$, and AR 5, $\phi = 0.16$: strain 2-50 means; long-interval variability retained.
